

## Intelligent Depot Systems - IDS

Identic specialises in supplying fully integrated depot management systems, Intelligent Depot Systems (IDS), for bus and truck fleet operators. Turnkey systems include pumping and distribution equipment, identification and registration systems and management software.

The Intelligent Depot Systems provide the fleet operator with powerful software tools which integrate information from key functions within the vehicle depot including information from refuelling and other day-to-day servicing activities, entry and exit movements and parking location. By combining this real-time information, Identic's Intelligent Depot Systems enable bus and truck fleet operators to improve efficiency and reduce costs.

### Automatic, Spill-Free Vehicle Refilling

The Identic AT-1 is a spill-free vehicle refilling (SVR) system, developed and produced by Identic and installed in over 200 depots and in over 50,000 vehicles world wide.

The modular system incorporates a spill-free coupling, which reduces spillage to a minimum, ensures a safer, cleaner working area and prevents pollution and environmental damage.

The system also incorporates an automatic overfill protection which allows optimal control of the refilling process.

## Automatic Vehicle Identification

There are many situations in a vehicle depot when there is a need to identify vehicles and also register vehicle information. Identic has developed a system which automates this identification and registration process.

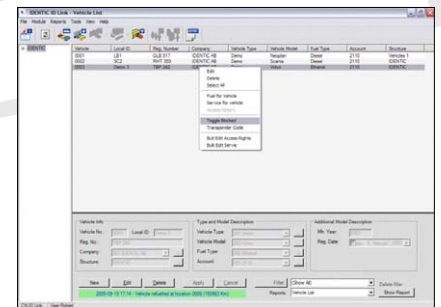

Identic's vehicle identification system, ID 850, gives a very reliable, wireless transmission of information between vehicle and depot through modulated infra-red light. Vehicle number, company code, mileage reading and other status information is automatically transmitted to the receiving system for authorisation, gate and parking control, database storage etc.

ID 850 is easy to install and ensures fast and reliable identification of moving as well as parked vehicles. The infra-red system is very reliable even in very demanding environments since it is not affected by electromagnetic interference, dirt, snow or moisture.

## Vehicle Management Software

ID Link is a powerful suite of Windows™ based programs for managing vehicle fleets within the depot area. Developed specifically for bus and truck fleet operators, ID Link Software brings together all the Identic systems to create an integrated fleet and depot management system.

ID Link uses advanced database tools to store the event information generated by Identic's hardware systems, including refuelling, parking and entry/exit data.

Using a modular approach ID Link can be tailored to both small and large fleet operators and is designed to suit single as well as multi-depot operations.
