

ID Link Software Solutions

Features

- View up-to-date status of all vehicles
- Access key information from anywhere in your organisation
- Combine information from any number of depots
- Generate, view and print user defined reports
- Export information to other systems

Providing the Tools to Reduce Costs

ID Link is a modular software package that brings together the key functions within a depot, creating a powerful tool to reduce costs and improve the day-to-day running of a modern vehicle fleet.

Identic supplies a range of depot management equipment to automate the key processes associated with the daily servicing of vehicles. These include; automatic vehicle identification, refuelling, entry/exit control and parking. ID Link brings together the events recorded by all these processes, in one central system. This ensures that essential operational information is always available and allows you to save valuable time, improve operational efficiency and reduce costs.

Easy to Use, Up-To-Date Information

For vehicle allocation and planning departments, ID Link provides fast up-to-date information on each vehicle's status, allowing planners to make faster decisions and save time.

For daily service and maintenance staff, ID Link allows routines to be streamlined, increasing vehicle utilisation and saving money.

By listening to our customers, Identic has created a user friendly software package that meets the needs of today's fleet operators. ID Link provides information in a clear and easy to use format.

A Modular System

ID Link is a modular based system that enables you to select the features you need today, while having the flexibility to add new modules when needed.

ID Link stores each transaction or event in a central SQL database, so it's easy to share or export information to other computerised systems within your organisation. Whether you're located within the same building or at a remote depot, ID Link enables you to access up-to-date information on the status of all your vehicles.

ID Link is designed to cope with a wide range of organisations and operations. Whether you're a large company with multiple depots or operating from a single location, ID Link can be configured to suit your needs.

By combining information from more than one module, ID Link provides a unique level of integration, allowing you to reduce costs and improve operational efficiency. A flexible report filter allows you to create reports using information from all the modules.

Refuelling Module

The efficient refuelling and daily servicing of heavy-duty vehicles has long been a central feature of Identic's Intelligent Depot System.

The Identic AT-1 provides a fast, efficient and safe method of fuelling vehicles. The AT-1 automates the dispensing of fuel, oil, and other chemicals. The system is integrated with Identic's automatic vehicle identification system, ID 850, which transmits vehicle data.

Vehicle identification and registration of dispensed volumes take place automatically, so the transaction data is extremely accurate. This ensures the vehicle status is always correct and up-to-date, a

vital factor when allocating vehicles to specific routes.

Gate Module

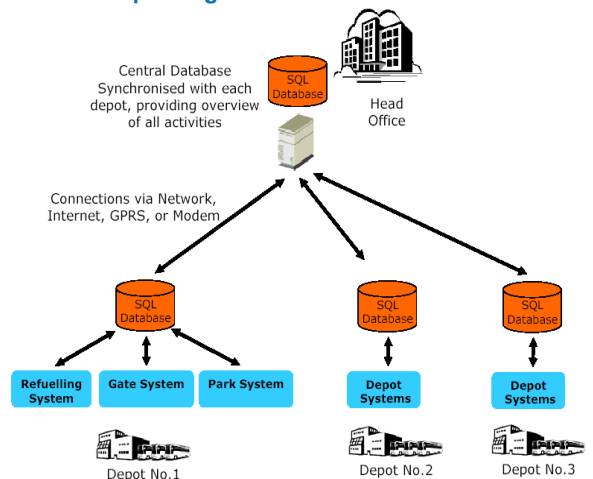

ID Link can be integrated with the Identic gate system. This allows the passage of vehicles, both in and out of the depot, to be recorded. Utilising Identic's automatic vehicle identification system, ID 850, the gate control system monitors each entry and exit event. Each event is sent to the database and includes time, date, vehicle ID and current kilometre reading.

This entry and exit information provides traffic planners with vital information on each vehicle's status. By utilising displays at entry and exit points, ID Link can be configured to automatically inform incoming vehicles of their next task, e.g. where to park or whether to refuel.

Parking Module

In many large depots, parking vehicles and locating them can create significant delays. ID Link can be integrated with the Identic vehicle parking system. This allows the position of vehicles within the parking area to be recorded. ID Link can display graphical views of the depot, indicating where vehicles are parked and the status of each vehicle.
